

## Radiator Panels & Towel Warmers

Radiator panels and towel warmers are common components of hydronic heating systems, delivering heat through circulating warm water. These fixtures are ideal for rooms that need faster heat-up times, zoned heating, or where aesthetic and functional comfort are priorities - such as bathrooms, bedrooms, and living areas.

### Key features

- Radiator panels are designed to heat rooms through convection and radiation.
- They are available in single, double, or triple panel with fins for increased surface area. Usually constructed from cast iron or steel.
- Towel warmers heat towels and add ambient heat to the bathroom.
- They are available in ladder, panel, and designer format.

### Considerations

- Radiators panels can be large taking up wall space.
- Radiators are more functional than decorative.
- Towel warmers have lower heat output.
- Towel warmers are best for small, enclosed spaces like bathrooms or powder rooms.

### Applications

- Retro fit in existing homes.
- Workshop or shed heating.
- Commercial and office heating.
- Ideal for new builds where floor heating it is not an option.
